**INTERNATIONAL PRELIMINARY  
EXAMINATION REPORT**

International application No. **PCT/NL 03/00295**

**I. Basis of the report**

1. With regard to the elements of the international application (*Replacement sheets which have been furnished to the receiving Office in response to an invitation under Article 14 are referred to in this report as "originally filed" and are not annexed to this report since they do not contain amendments (Rules 70.16 and 70.17)*):

**Description, Pages**

1-23 as originally filed

**Claims, Numbers**

1-59 filed with telefax on 01.09.2003

**Drawings, Sheets**

1/9-9/9 as originally filed

2. With regard to the **language**, all the elements marked above were available or furnished to this Authority in the language in which the international application was filed, unless otherwise indicated under this item.

These elements were available or furnished to this Authority in the following language: , which is:

- ☐ the language of a translation furnished for the purposes of the international search (under Rule 23.1(b)).  
☐ the language of publication of the international application (under Rule 48.3(b)).  
☐ the language of a translation furnished for the purposes of international preliminary examination (under Rule 55.2 and/or 55.3).

3. With regard to any **nucleotide and/or amino acid sequence** disclosed in the international application, the international preliminary examination was carried out on the basis of the sequence listing:

- ☐ contained in the international application in written form.  
☐ filed together with the international application in computer readable form.  
☐ furnished subsequently to this Authority in written form.  
☐ furnished subsequently to this Authority in computer readable form.  
☐ The statement that the subsequently furnished written sequence listing does not go beyond the disclosure in the international application as filed has been furnished.  
☐ The statement that the information recorded in computer readable form is identical to the written sequence listing has been furnished.

4. The amendments have resulted in the cancellation of:

- ☐ the description, pages:  
☐ the claims, Nos.:  
☐ the drawings, sheets:

**INTERNATIONAL PRELIMINARY  
EXAMINATION REPORT**

International application No. **PCT/NL 03/00295**

5. ☐ This report has been established as if (some of) the amendments had not been made, since they have been considered to go beyond the disclosure as filed (Rule 70.2(c)).

*(Any replacement sheet containing such amendments must be referred to under item 1 and annexed to this report.)*

6. Additional observations, if necessary:

**III. Non-establishment of opinion with regard to novelty, inventive step and industrial applicability**

1. The questions whether the claimed invention appears to be novel, to involve an inventive step (to be non-obvious), or to be industrially applicable have not been examined in respect of:

☐ the entire international application,

☒ claims Nos. 59

because:

☐ the said international application, or the said claims Nos. relate to the following subject matter which does not require an international preliminary examination (specify):

☒ the description, claims or drawings (*indicate particular elements below*) or said claims Nos. are so unclear that no meaningful opinion could be formed (*specify*):

**see separate sheet**

☐ the claims, or said claims Nos. are so inadequately supported by the description that no meaningful opinion could be formed.

☐ no international search report has been established for the said claims Nos.

2. A meaningful international preliminary examination cannot be carried out due to the failure of the nucleotide and/or amino acid sequence listing to comply with the standard provided for in Annex C of the Administrative Instructions:

☐ the written form has not been furnished or does not comply with the Standard.

☐ the computer readable form has not been furnished or does not comply with the Standard.

**V. Reasoned statement under Article 35(2) with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement**

**1. Statement**

Novelty (N)	Yes: Claims	1-58
	No: Claims	
Inventive step (IS)	Yes: Claims	
	No: Claims	1-58
Industrial applicability (IA)	Yes: Claims	1-58
	No: Claims	

**2. Citations and explanations**

**INTERNATIONAL PRELIMINARY  
EXAMINATION REPORT**

International application No. PCT/NL 03/00295

---

see separate sheet

**Section III:**

The new claim 59 is derived from original claim 60 which has not been searched due to the provisions of Rule 6.2 (a) PCT.

**Section V:**

*1). Relevant documents*

Reference is made to the following documents:

D1: GB 328 145 A

D2: US 5 450 706 A

D3: EP 1 041 005 A

*2). Claim 1*

The present application does not meet all the criteria listed in Article 33 (1) PCT, because the subject-matter of independent claim 1 is not inventive within the meaning of Article 33 (3) PCT.

Document D1, which is to be considered as the closest piece of prior art, discloses a device for packaging products having a head and a stick, such as lollipops, in wraps, comprising a frame including first supply means (s. [10]) for supplying the products, second means (s. description: page 4, line 3) for supplying a web of wrapping material, means for cutting (s. description: page 4, line 6) a wrap from the web, a wrapping station (s. [25]+[11]) having a driven series of means (s. [25]) retaining the products and circulating in a first direction about a horizontal shaft (s. Fig. 1), and a drum (s. [11]) driven in the same direction having means for enveloping (s. [29]) the product heads with a wrap and means (s. [33]+[34]) for securing the wrap on the products, the wrapping station comprising a supply station (s. left part of 'pocket wheel' [11] in Fig. 1) and a discharge station (s. right part of 'pocket wheel' [11] in Fig. 1), the second supply means being positioned for supplying the web (s. [23] in Fig. 1) of wrapping material according to a path that is tangential to the drum.

Therefore, the subject-matter of claim 1 only differs from the device of document D1 in that - the product to be packaged and the packaging material, when they come in interaction, run in the same direction and not in the opposite direction.

The above feature is well known in the packaging field and the skilled person, namely when the same result is to be achieved, would immediately apply this feature with

corresponding effect to the device of document D1, thereby arriving at the device of claim 1, without having performed any inventive step (Article 33 (3) PCT).

*3). Dependent claims 2-28*

Claims 2-28, as presently formulated, show additional features, which, in combination with the features of the claims to which they refer, lead to subject-matters that are well known in the art. Therefore they are not inventive within the meaning of Article 33 (3) PCT.

*4). Claim 29*

The present application does not meet all the criteria listed in Article 33 (1) PCT, because the subject-matter of independent claim 29 is not inventive within the meaning of Article 33 (3) PCT.

Document D2 discloses a device for packaging lollipops, having all the features of claim 29, with the only exception of the wrapping station and the drum circulating about a vertical shaft instead of a horizontal shaft. This feature is, on the other hand, comprised by the device of document D1 (s. Point 2 above).

D2 (s. claim 12) discloses in particular the securing means comprising pairs of heat welding arms, that are also part of the enveloping means and forming a kind of diaphragm (s. [370]) in there.

Also Document D3 (see 'slit sealing clips' [4.4]) discloses said pair of heat welding arms (Article 33 (3) PCT).

*5). Dependent claims 30-58*

Claims 30-58, as presently formulated, show additional features, which, in combination with the features of the claims to which they refer, lead to subject-matters that are well known in the art. Therefore they are not inventive within the meaning of Article 33 (3) PCT.

The subject-matter of claims 1-58 is industrially applicable (Article 33 (4) PCT).

*6). Further general remarks*

6.1). Claims 44-47, 49-54 and 56-57 are wrongly referred back to themselves (Article 6 PCT).

6.2). Contrary to the requirements of Rule 6.2 (b) PCT, the features of the claims are not provided with reference signs placed in parentheses. *This can eventually undermine the*

**INTERNATIONAL PRELIMINARY  
EXAMINATION REPORT - SEPARATE SHEET**

---

International application No. PCT/NL 03/00295

*clarity of the claims (Article 6 PCT).*

6.3). Contrary to the requirements of Rule 5.1. (a) (ii) PCT, documents D1-D2 are not identified in the description and the relevant background art disclosed therein is not briefly discussed.

6.4). Contrary to the requirements of Rule 6.3 (b) PCT, claims 1 and 29 are not drafted in the two-part form.

**10/511580**

DT01 Rec'd PCT/PTO 18 OCT 2004

**Claims**

1. Device for packaging products having a head and a stick, such as lollipops, in wraps, comprising a frame including first supply means for supplying the products, second means for supplying a web of wrapping material, means for cutting a wrap from the web, a wrapping station  
5 having a driven series of means for retaining the products and circulating in a first direction about a horizontal shaft, and a drum driven in the same direction having means for enveloping the product heads with a wrap and means for securing the wrap on the products, the wrapping station comprising a supply station and a discharge station, the second supply  
10 means being positioned for supplying the web of wrapping material according to a path that is tangential to the drum, in a direction running along with the drum rotation.
2. Device according to claim 1, the second supply means being positioned  
15 for substantially vertical supply.
3. Device according to claim 2, the retaining means and the drum being driven for carrying out a substantially downward motion at the location of the supply station.  
20
4. Device according to any one of the preceding claims, furthermore provided with a discharge station for discharge of the packaged products from the retaining means, the discharge station being placed at the location of the upper side of the drum.  
25
5. Device according to any one of the preceding claims, the second supply

- 2 -

means being adapted for continuous supply of the web of wrapping material.

5 6. Device according to claim 5, the second supply means and the means for driving the drum being adjustable to each other for causing the web speed of the web of wrapping material to be equal to the circumferential speed of the drum at the location of the retaining means.

10 7. Device according to claim 5 or 6, the second supply means comprising a pair of drive rollers and a servo motor for the driving thereof.

15 8. Device according to any one of the preceding claims, furthermore provided with means for detecting markings on the web of wrapping material, such as a photocell, means for measuring the web speed, as well as with means for determining the actual distance between the markings based on the data of the detection means and the measuring means and means for adjusting the drive of the web of wrapping material to the determined actual distance between the markings.

20 9. Device according to claim 8, the cutting means being positioned stationary, but adjustable in the transport direction of the web, preferably at half a wrap length upstream from a radial plane through the drum perpendicular to the transport direction of the web.

25 10. Device according to claim 8 or 9, the drive of the cutting means being synchronisedly coupled to the drive means for the drum, so that the cutting means run in register with the retaining means etc. on the drum.

30 11. Device according to claim 10, an encoder being provided on the cutting means or on the drive means for the drum, and the encoder being coupled to a control unit for mutual adjustment to the control of the driving of the web of wrapping material.

- 3 -

12. Device according to any one of the preceding claims, the drum being provided with means for gripping the product head after the product head has been enveloped with a wrap, and with means for rotating the head gripping means during securing the wrap on the product by the securing means, which gripping means have two pairs of opposite arms.

13. Device according to any one of the preceding claims, the securing means comprising heat welding arms that are also part of the enveloping means and forming a kind of diaphragm in there, the drum furthermore being provided with means for moving the heat welding arms from a first position in which they define a passage for the product head and a second position in which the wrap is secured by heat welding, the heat welding arms being provided with welding heads, that are connected to a power source by means of bendable conductive strips, preferably copper strips.

14. Device according to claim 13, the conductive strips being multiple circumferentially bent.

15. Device according to claim 13 or 14, the conductive strips forming torsion springs.

16. Device according to claim 13, 14 or 15, the conductive strips being conductively connected to conductors that are stationary with the drum.

17. Device according to claim 16, the conductive strips being connected to conductors that are stationary with the drum at a location between the strip ends and at the ends being connected to members stationary with the heat welding arms.

18. Device according to any one of the claims 13-17, two bendable conductive strips being provided for each heat welding arm, which strips have been connected to both the exits of the power source, respectively,

- 4 -

the bendable conductive strips preferably being spaced apart in a direction transverse to the movement of the arm.

5 19. Device according to any one of the claims 13-18, the heat welding arms being positioned rotatable about their own arm shafts, preferably being rotatable about spaced apart shafts, preferably spaced apart in radial direction of the drum, both heat welding arms preferably being coupled to each other for simultaneous movement.

10 20. Device according to claim 19, the shafts of the respective heat welding arms being provided with inter-engaging teeth, one of the shafts being driven.

15 21. Device according to claim 20, the driven shaft being driven in the drum by means of leverage.

20 22. Device according to claim 16 and claims depending on claim 16, several heat welding arms arranged in the circumferential sense of the drum being attached to the stationary conductors.

25 23. Device according to claim 13-22, at least one of all heat welding arms being provided with means for measuring the welding temperature at the welding head, which measuring means have been connected to regulating means for the power source for the welding heads for delivering a respective measuring signal.

24. Device according to claim 23, the measuring means comprising a PT100 element on the heat welding arm.

30 25. Device according to claim 23 or 24 and claim 16, the measuring means comprising measuring conductors that have been attached to the stationary conductors in an insulated manner.

- 5 -

26. Device according to claim 23, 24 or 25, the measuring means being connected to the base of a heat welding arm having a fork-shaped welding head.

5 27. Device according to any one of the claims 23-26, of a pair of heat welding arms only one of the arms being provided with the measuring means.

10 28. Device according to any one of the claims 23-27, only one of the pairs of heat welding arms being provided with the measuring means.

15 29. Device for packaging products having a head and a stick, such as lollipops, in wraps, comprising a frame including first supply means for supplying the products, second means for supplying a web of wrapping material, means for cutting a wrap from the web, a wrapping station having a driven series of means for retaining the products circulating in a first direction about a horizontal shaft, and a drum driven in the same direction having means for enveloping the product heads with a wrap and means for securing the wrap on the products, the securing means  
20 comprising pairs of heat welding arms, that are also part of the enveloping means and forming a kind of diaphragm in there, the drum furthermore being provided with means for moving the heat welding arms between a first position in which they define a passage for the product head and a second position in which the wrap is secured by heat welding, the heat  
25 welding arms being provided with welding heads that are connected to a power source by means of bendable strips of conductive material, such as copper.

30 30. Device according to claim 29, the conductive strips being multiple circumferentially bent.

31. Device according to claim 29 or 30, the conductive strips forming

- 6 -

torsion springs.

5 32. Device according to claim 29, 30 or 31, the conductive strips being conductively connected to conductors that are stationary with the drum, preferably at a location between the strip ends and the strips preferably being connected at the ends to parts that are stationary with the heat welding arms.

10 33. Device according to any one of the claims 29-32, two bendable conductive strips being provided for each heat welding arm, which strips have been connected to both the exits of the power source, respectively, the bendable conductive strips preferably being spaced apart in a direction transverse to the movement of the arm.

15 34. Device according to any one of the claims 29-33, the heat welding arms being positioned rotatable about their own arms shafts, preferably both heat welding arms being rotatable about spaced apart shafts, preferably spaced apart at radial distance, both heat welding arms preferably being coupled to each other for simultaneous movement.

20 35. Device according to claim 34, the shafts of the respective heat welding arms being provided with inter-engaging teeth, one of the shafts being driven, the driven shaft preferably being driven in the drum by means of leverage.

25 36. Device according to claim 33 and claims depending on claim 33, several heat welding arms arranged in the circumferential sense of the drum being attached to the stationary conductors.

30 37. Device according to any one of the claims 29-36, at least one of all heat welding arms being provided with means for measuring the welding temperature at the welding head, which measuring means have been

- 7 -

connected to adjustment means for the power source for the welding heads for transmitting a respective measuring signal, the measuring means preferably comprising a PT100 element on the heat welding arm.

5 38. Device according to claims 33 and 37, the measuring means comprising measuring conductors that have been attached to the stationary conductors.

10 39. Device according to claim 37 or 38, the measuring means being connected to a heat welding arm with the base of a fork-shaped welding head.

40. Device according to claim 37, 38 or 39, of a pair of heat welding arms only one of the arms being provided with the measuring means.

15 41. Device according to any one of the claims 37-40, only one of the pairs of heat welding arms being provided with the measuring means.

20 42. Device according to any one of the preceding claims, the drum being provided with means for gripping the product head after the product head has been enveloped with a wrap, and with means for rotating the head gripping means during securing the wrap on the product by the securing means, the securing means comprising pairs of heat welding arms, that are also part of the enveloping means and forming a kind of diaphragm in  
25 there, the drum furthermore being provided with means for moving the heat welding arms from a first position in which they define a passage for the product head and a second position in which the wrap is secured by heat welding, the movement means being arranged at the same side of the drum as the rotation means for the gripping means, preferably at the  
30 outside of the drum and the frame.

43. Device according to claim 42, the drum comprising means for

- 8 -

screening the movement means and the rotation means from the space where the products are being packaged, which are situated at the side of the movement means and the rotation means facing away from the outside of the drum.

5

44. Device according to claim 44, the drum being hinged to the frame.

45. Device according to claim 45, provided with locking means for securing the drum to the frame in an operative position.

10

46. Device according to claim 46, the locking means comprising a bolt extending through the frame and the drum.

15

47. Device according to claim 46, the locking means on the drum comprising means that are active on pressure difference.

20

48. Device according to any one of the preceding claims, the first supply means furthermore comprising a number of consecutively positioned disks, that are consecutively driven oppositely, the disks being provided with receiving spaces for one stick each, and curved edge strips being positioned at the circumference of the disks for retaining the sticks in the receiving spaces.

25

49. Device according to claim 49, of each pair of consecutive disks a first disk at the circumference being provided with equal receiving spaces and the accompanying curved edge strip being adjustable with respect to the receiving spaces and a second disk at the circumference being provided with groups of receiving spaces of different sizes and the accompanying curved edge strips being stationary.

30

50. Device according to claim 50, the second disks being adjustable with respect to their driving shaft.

- 9 -

51. Device according to claim 51, the second disks being provided with indication means for the sizes of the different receiving spaces.

52. Device according to claim 52, the indication means being formed by calibration holes corresponding to common stick thicknesses.

53. Device according to any one of the claims 49-53, the second disks being provided with a circumferential edge having sawteeth, that are preferably oriented in downstream direction.

10

54. Device according to any one of the claims 49-54, the first supply means comprising a singling station, where the products are brought from a situation bulk into a singled situation, the disks being positioned for transport of the products from the singling station to the retaining means.

15

55. Device according to any one of the preceding claims, furthermore comprising a singling station for products supplied in a bulk, comprising a first discharge means for the products in bulk, a turning table assembly placed below it, and a second discharge means for the singled products, the turning table assembly comprising a distribution disk, positioned for rotation of the first discharge means to the second discharge means and in the circumferential area being provided with means for receiving the product heads, as well as a spreading disk placed within the circumferential area, that is oppositely driven and has a support surface for the products coming from the first discharge means and discharging them to the circumferential area of the distribution disk, the support surface being substantially flat.

20

25

56. Device according to claim 56, the spreading disk extending with an edge area over the circumferential area of the distribution disk.

30

57. Device according to claim 57, the edge area sloping radially to the

- 10 -

outside.

58. Device according to any one of the preceding claims, furthermore comprising a singling station for products supplied in bulk, comprising a  
5 first discharge means for products in bulk, a turning table assembly placed below it, and a second discharge means for the singled products, the turning table assembly comprising a distribution disk, which is positioned for rotating of the first discharge means to the second discharge means  
10 and in a circumferential area being provided with means for receiving the product heads, as well as a spreading disk placed within the circumferential area, that is oppositely driven and has a support surface for the products coming from the first discharge means and discharging them to the circumferential area of the distribution disk, the spreading disk at least  
15 partially being sunk into the distribution disk.

59. Device provided with one or more of the characterising measures described in the attached description and/or shown in the attached drawings.

(octroon\169219\ds AF\NG 2420)
